

str

Part-2

Agenda

- ① format
- ② split
- ③ join

format

string.format(var1, var2, ...)

```
print("{} , how are you?".format("Saunabh"))
```

```
print("{} {} , {} {}".format("one", 25, 3.5))
```

```
print("{} {} , {} {}".format(10, 20, 30))
```

Split and join

`s1 = "Tejas Virjibhai Patel"`

`l1 = s1.split('')`

Split function returns a list of splitted strings

`l1 = ["Tejas", "Virjibhai", "Patel"]`

Taking input list elements

`s1 = "35, 40, 20, 10, 55, 80, 17, 60"`

`l1 = s1.split(',')`

`l1 = ["35", "40", "20", "10", "55", "80", "17", "60"]`

`mylist = [int(e) for e in l1]`

`= [35, 40, 20, 10, 55, 80, 17, 60]`

join()

l1 = ["25", "12", "2022"] list of str

list of str → str

"25122022"

"25/12/2022"

"25-12-2022"

s1 = "-".join(l1)

join returns a str type value

Split $\rightarrow$ str $\rightarrow$ list of str base string

join $\rightarrow$ list of str $\rightarrow$ str base string

s1 = 'Patel Web Solution'

base string = ' ' (space)

s1.split(' ') $\rightarrow$ ['Patel', 'Web', 'Solution']

l1 = ['Education', 'Services']

base string = ' ' (space)

baseString.join(list of str)

' '.join(l1) $\rightarrow$ 'Education Services'
